UNITY CATALOG by Anash

what is unity catalog?

unity catalog is a centralized data catalog that provides access control, auditing, lineage, quality monitoring & data discovery capabilities across Databricks workspaces

Features:-

* Define once, secure everywhere
* Built-in auditing & lineage
* Data discovery.

IWM -> Inteligent workload management for serverless-computing cluster.

Data Masking:-

Hiding data inside table for security & intigrity purpose.

Ex:- Employee table have salary column but every group don't get access to see it Some groups have to use it Some groups don't, So we apply data masking to hide the data it shows that column data in form of special symbols.

Managed tables	External tables
* Databricks manages both meta data & actual storage data	* Databricks manages only meta data.
* multitool access -> Difficult	multi tool access -> easy
* Data governance -> unity catalog controls everything	* Data governance -> Flexible but required discipline.
* use case -> Quick analytics, fully governed data	* use case -> Data shared with other tools & pre-existing datasets.
